

# Logistic Regression Analysis on Readmission of Each Patient

karmaGyatso

2022-10-31

## Abstract

After getting discharge from the hospital, the least thing to expect is to re-hospitalize again. However, the average rate of readmission in hospital is 15.50% in the US. Some readmissions, such as those for cancer and related treatment, are expected and planned, but many readmissions are not. In this project, we will be cleaning the data and analysing logistic regression to find the probability of each patient re-admitting in the hospital based on data of Internal Medicine.

## Data Presentation

```
library(tidyverse)
```

```

## Analysis

According to the chart, we can see that graph is left-skewed distribution. We can also see that the Caucasian are the most common patient for internal medicine and they most visited age is between 70 - 80 young old.

```
ggplot(internal_medicine_treatment, aes(x = age)) +  
  geom_bar(aes(fill = race )) +  
  labs(title= "Hospital readmission by age",  
        x="age_group",y="total count")
```

## Frequency Count

Quick frequency count on column readmittedm, race, and age

```
xtabs(~ readmitted +  
      race + age, data = internal_medicine_treatment)
```

```
## , , age = [0-10)  
##  
##      race
